

Performance Test Report

For

Execution of

Preregistration module – 300 users

Date: 14 Apr 2020

Author: Anand Babaleshwar

Summary

This report presents the observations and findings of the load test conducted for a load of 300 concurrent users performing booking full flow scenario for 1.05-hour duration

The objective of this load test was to observe and record the behavior of the application when users are performing booking full flow scenario

Below are the scenario details:

Identified Key scenarios:

1) MOSIP_PT_PreReg_UI_BookingfullFlow

| | |
|-----------------------------------|--|
| Run Date | 14-Apr-2019 |
| Period | 08:45 to 09:51 AM (UTC) |
| Number of concurrent users | 300 |
| Ramp up | 300 users ramp up in 4 min and steady for 60 min |
| Run Duration | 1.05 hours |
| Ramp down | 4min |

The transaction response times observed were as below:

| Label | # Samples | Average (ms) | 90% Line (ms) | Min (ms) | Max (ms) | Error % | Throughput (sec) |
|-----------------------------------|-----------|--------------|---------------|----------|----------|---------|------------------|

| TR_prereg_notify | 5939 | 38.431 | 180013 | 315 | 180083 | 20.32% | 1.58161 |
| TR_prereglogout | 4722 | 142 | 204 | 80 | 5609 | 0.00% | 1.79324 |

Important Note:

- Logout is not working in preprod environment ,So ignored errors – <https://mosip.atlassian.net/browse/MOS-30796>
- We have major blocker issue with auth token failures for submit demographic ,As a workaround we have restarted all pods of kernel as well prereg modules and started performance run - <https://mosip.atlassian.net/browse/MOS-31208>

Performance Test Execution Details

Most of the transactions average response times were more than 3sec mentioned below:

1. TR_prereg_bookappointment -59.111 sec
2. TR_prereg_notify-38.431 sec

The error rate for below transactions are more than 1%:

| Transactions | Error % |
|------------------|---------|
| TR_prereg_notify | 20.32% |

For pre-registration-booking service observed high response time

For pre-registration-notification-service observed spike of intermittent invalid response and read timeout errors -<https://mosip.atlassian.net/browse/MOSIP-436> ,
<https://mosip.atlassian.net/browse/MOS-27275>

Response Time Graph

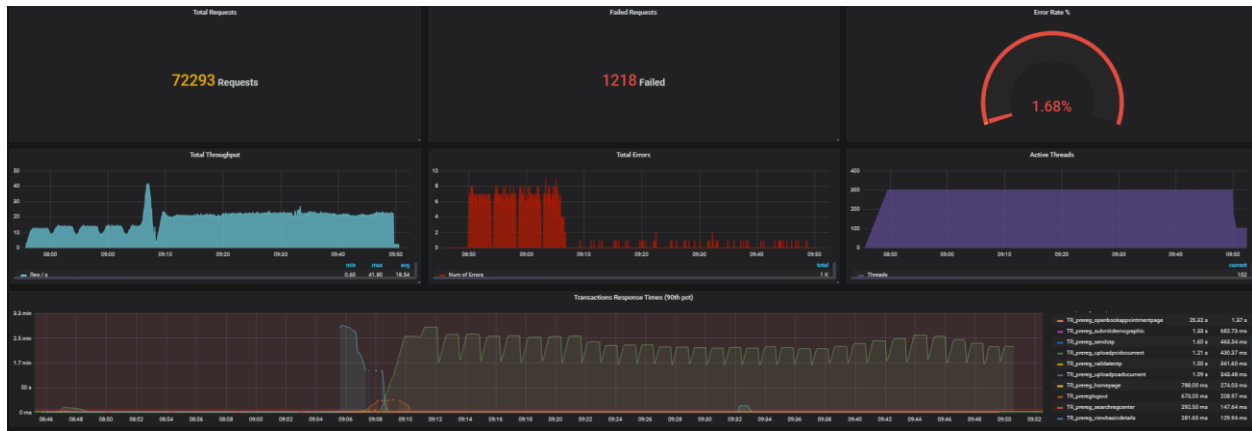

Transactions per second:

Active threads vs response times over time:

JMeter graph:

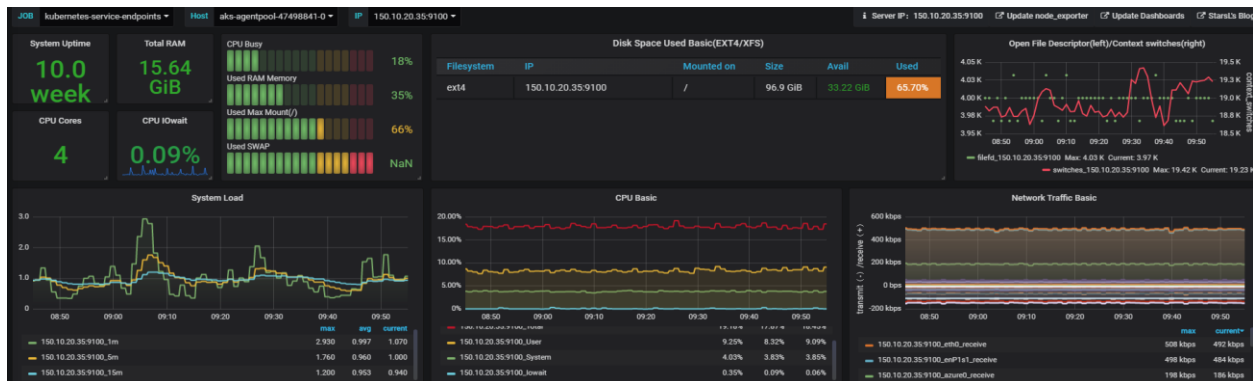

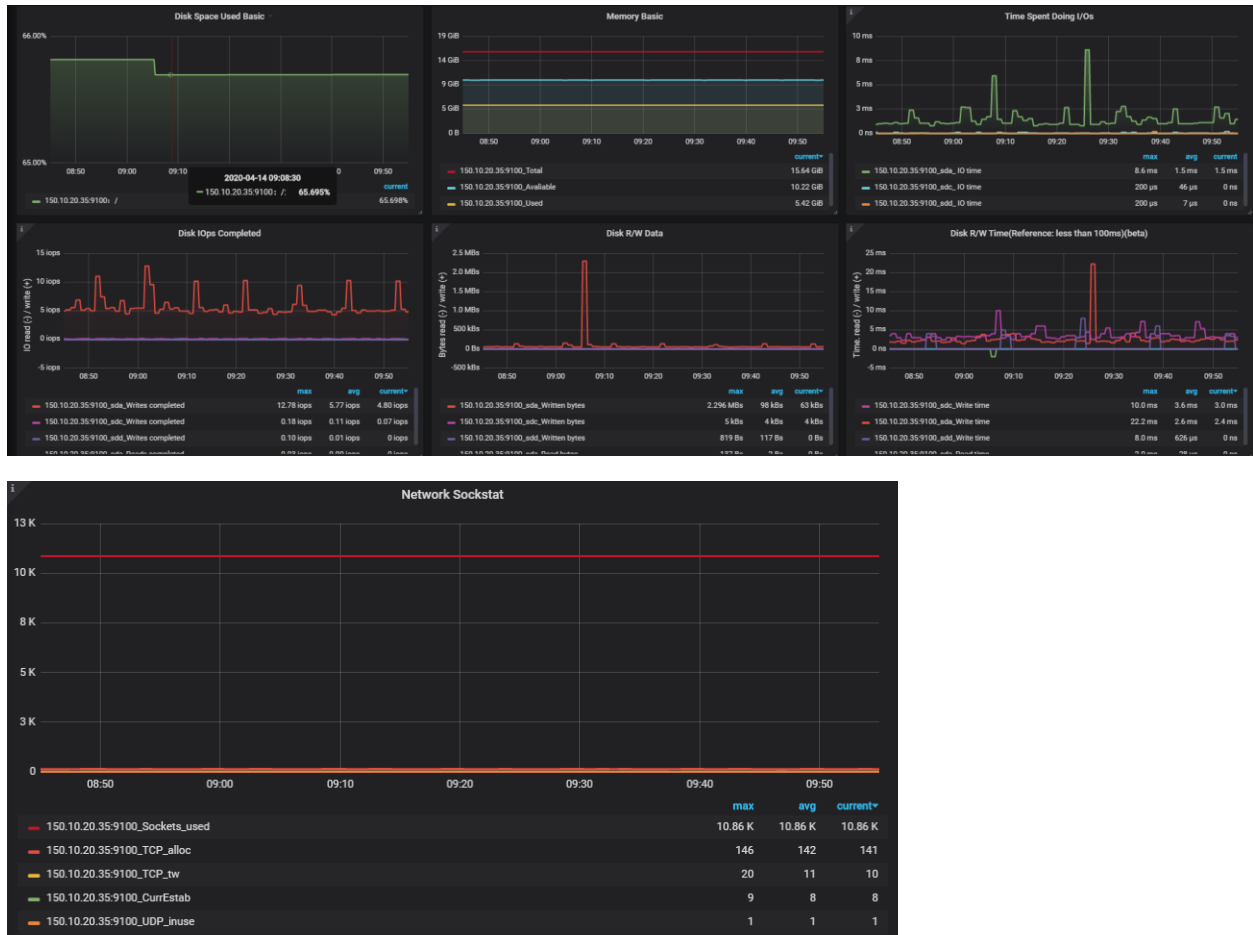

Preregistration cluster node monitoring

Observations:

- Max Total CPU basic is 19.18% and Avg is 17.87%
- Max used memory is 5.42 Gib out of 15.64 Gib

System avg load:

Observations:

- Max system load for 1 min interval is **2.930** and average is **0.997**

Preregistration DB node monitoring:

Observations:

- Max Total CPU basic is 14.20% and Avg is 05.59%
- Max used memory is 1.01 Gib out of 7.78 Gib

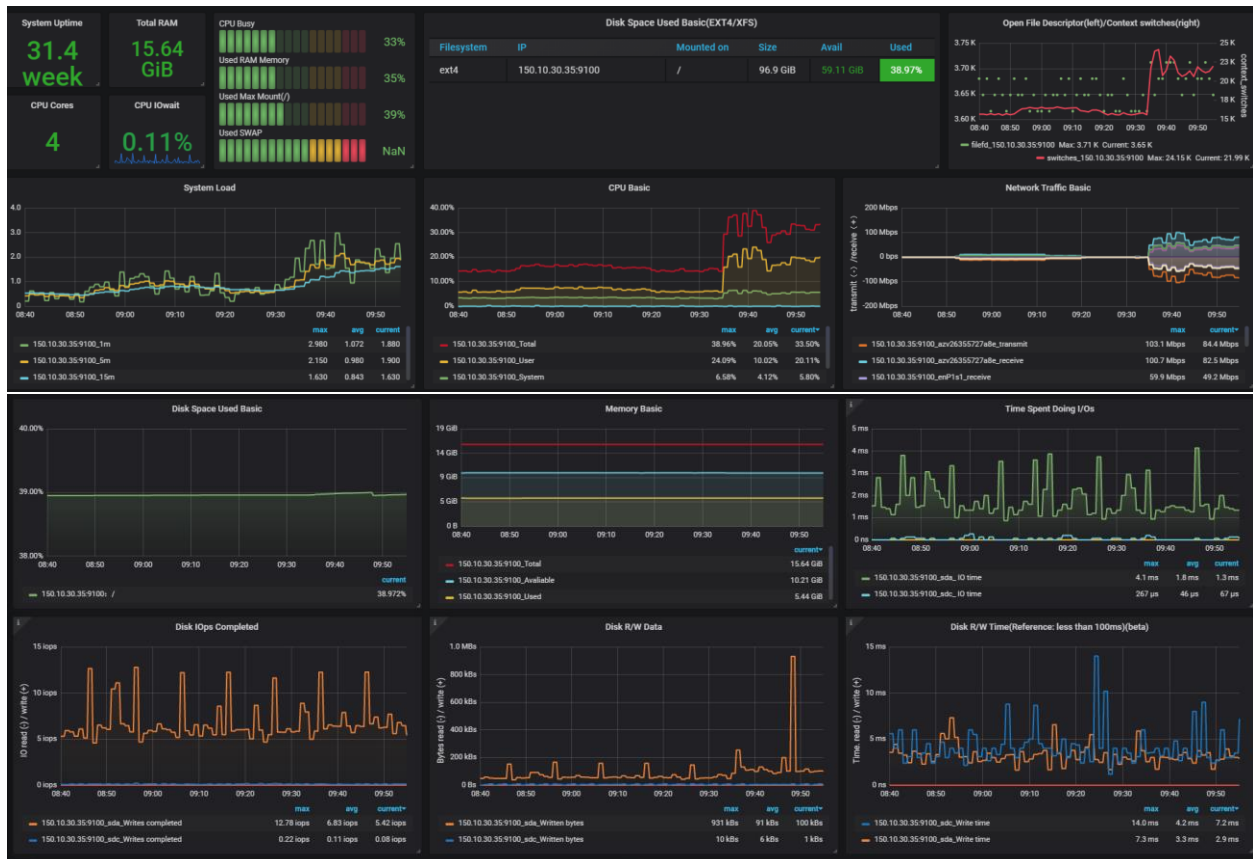

Kernel cluster node 0 monitoring:

Observations:

- Max Total CPU basic is 38.96% and Avg is 20.05%
- Max used memory is 5.44 Gib out of 15.64 Gib

Kernel cluster node 1 monitoring:

Observations:

- Max Total CPU basic is 28.04% and Avg is 10.26%
- Max used memory is 4.45 Gib out of 15.64 Gib

Conclusion and Next Steps:

We have decided to test for 300 as we were receiving more number of read timeout errors for most of the transactions for 400, 500, 600 and 700 concurrent users

Issues for 300 concurrent users:

For pre-registration-notification-service observed spike of intermittent invalid response and read timeout errors
